In this tutorial, I will walk you through how you can create and edit images using Photoshop. When opening Photoshop, there are many options that you can use to start your project. The options you choose at the beginning of the work will influence the outcome. While you don't have to start with the most powerful options available, these are the most basic options available. To the right is a screenshot of Photoshop on a Mac. To the left is a screenshot of Photoshop on Windows. The Windows screenshots are identical except that the menu bar is not at the top of the Photoshop window. Photoshop Menu Items The most important element of Photoshop is the menu. Each menu item in Photoshop represents a user-defined function. For example, there is an Image menu that allows you to use Photoshop's basic tools. An Effects menu allows you to use Photoshop's tools to change a photo's effects. The Elements menu is where you edit all of Photoshop's basic elements—primitives like lines, colors, and shapes. Other than the Tools menu, there are other menus to choose from. They include the Paths menu, the Layers menu, and the Menu Bar. All of these menus have the following properties: Image menu (when working in the image itself) I can edit objects from my computer, other graphics, scanned images, and the Photos library Transform menu (when working on other layers) I can rotate, skew, and scale the image on my canvas Navigation menus (when working with layers) If the image is in the Layers panel, I can drag the image out of the Layers panel and into a Photoshop window If the image is on the canvas, I can use the Selection tool to select the area I want to work on If the image is a Smart Object, I can drag the object out of the Layers panel and into a Photoshop window Current folder (when working with files or projects on your computer) I can drag, drop, or move the file to a different folder on my computer Photoshop History panel (located on the main editing screen) I can restore individual files to their previous versions Layers panel (when editing other layers) I can create and work with new layers The Paths menu (when editing shapes) I can use this menu to draw shapes and edit curves

The aldehyde dehydrogenases (ALDHs) are a superfamily of enzymes that catalyze the oxidation of aldehydes to the corresponding carboxylic acids with reduction of nicotinamide adenine dinucleotide (NAD(+)). We describe here a highly selective and sensitive method for the determination of aldehydes based on our previously reported colorimetric sensing platform. Our method is based on the catalytic reaction of aldehydes with hexacyanoferrate(III), which is highly selective and causes a colorimetric change in the presence of ALDHs. The key feature of our work is the use of immobilized ALDHs in fiber optic biosensors (FOBs), leading to highly selective responses. The performances of the sensing system were examined using highly toxic aldehydes such as 2-nitro-2-methylpropane-1,3-diol, 4-hydroxybenzaldehyde, 4-nitro-benzaldehyde, 4-nitro-phenol, 4-methoxy-benzaldehyde, 4-methoxy-2-nitro-phenol, and 2-nitrophenol. To illustrate the practical application of our sensing method, we succeeded in the detection of drinking water by using 2-nitro-2-methylpropane-1,3-diol.The overall goal of this project is to elucidate the molecular mechanisms of initiation of DNA replication in the genome of Mycoplasma genitalium. Initiation of replication is a complex process involving the assembly of prereplicative complexes on origins of replication. Several different initiation pathways are observed during early and mid S phase in the unicellular eukaryote, S. cerevisiae. Although a number of proteins are required for initiation of replication of bacterial and archaeal DNA, replication initiation in yeast is orchestrated by the

Infections of the central nervous system (CNS) in HIV-1 infected persons represent a major source of morbidity and mortality worldwide. Despite the advent of antiretroviral therapy, which has dramatically decreased the incidence of opportunistic infections, the number of HIV-1 associated neurocognitive disorders (HAND) continues to increase, and the underlying mechanisms are only partially understood. Mounting evidence suggests that chronic, persistent systemic inflammation may be a common link in the pathogenesis of HAND. However, the effects of inflammation and viral brain infection on synaptic plasticity within the CNS remain largely unexplored. Neurotrophin-3 (NT-3) and its receptor (trkC) are well known to regulate differentiation and maintenance of neurons in the developing brain, but it has not been investigated whether these neurotrophins also mediate synaptic plasticity and neuroprotection in the adult brain. We recently found that NT-3 and its receptor are co-expressed in a subset of cortical and hippocampal neurons, which is in close proximity with the synapse. We further demonstrated that NT-3 plays an important role in maintaining the normal function of the CNS by protecting neurons against oxidative stress and improving the survival of neurons during ischemia. Further, NT-3 has been shown to inhibit both HIV-1 replication and monocyte-mediated TNF-1 release from microglia. These results suggest a model wherein neurotrophin/receptor signaling negatively regulates HIV-1 infection and inflammation in the CNS via an intracellular, autocrine and/or paracrine mechanism. Therefore, we hypothesize that NT-3 plays a critical role in regulating the CNS milieu, and that disruption of the NT-3 signaling pathway leads to neurodegeneration and HAND in HIV-1 infected individuals. Aim 1 of this proposal is to determine whether NT-3/trkC signaling is required to protect neurons against HIV-1 and neurotoxins in the adult brain. In this aim, we will use a combination of in vitro and in vivo approaches to evaluate the effects of HIV-1 Tat on NT-3 receptor expression and the neurotrophic and neuroprotective properties of NT-3/trkC signaling in primary neurons, astrocytes, microglia and astrocytes in co-culture. Our in vivo studies will further test whether reduction of NT-3/trkC signaling alters the susceptibility of neurons to HIV-1 Tat, and whether it exacerbates behavioral
